Roadmap

YWhisper is currently at a nascent stage in terms of features and capabilities. Over time we aim to grow the solution and have the Hemkunt foundation test our platform for their drives. This would help us identify points of improvement while also helping us understand the pain points of the NGO better.

Over time we aim to scale the solution using various IBM services by implementing features such as:

1. Face recognition to identify the people who have received the kits to improve tracking the distribution numbers.
2. Add dashboards to help the NGO analyse their data better and gain insights such as efficiently scheduling the drives, finding areas in need and highlighting issues in the current pipeline.
3. Extend the solution to support various NGOs and their requirements to help them continue with their initiatives safely.
4. Use the IBM Translation APIs to support regional languages to send notifications as well as add support for automated calls in regional languages to increase our outreach.
